Practice solving bond problems

Bonds

It is not unusual that either companies or governments themselves need extra funds to expand into new markets or raise funds to pay for programs. In these cases, they typically need large quantities of money that the average bank cannot provide. Raising money by issuing bonds to a public market is one solution.

By purchasing bonds, an investor becomes a creditor to the corporation or government. Many investors have at least part of their portfolio invested in bonds. The issuer of a bond must pay the investor a "fee" (interest payments) for the privilege of using his or her money. The interest rate is often referred to as the coupon, and the date on which the issuer has to repay the amount borrowed (face value) is called the maturity date. The total return an investor receives if the bond is held to maturity is equal to all the interest payments received plus any gain or loss. This is called the yield to maturity, or YTM.

Bonds on the HP 20b

The HP 20b solves these types of breakeven problems using the Bond menu. This menu is entered by pressing  and contains areas where you can enter or compute values related to bond problems. You can compute the price, yield to maturity, yield to call, and accrued interest using this menu. You can solve problems related to bonds that pay interest semiannually or annually. You can also use an actual 365-day calendar or a 360-day, twelve 30-day month calendar if you wish.

The map of this menu is presented below. To move from one item in the menu to the next, press the down arrow key . This key is abbreviated DWN in the map below. At the top of the next page is a table explaining each of the entries in the bond menu in more detail.

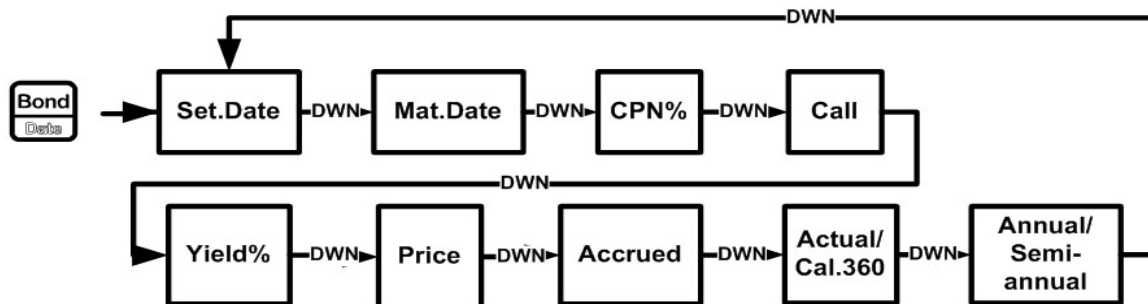

Figure 1 The Menu Map for the Bond Menu

The Yield% and Price menu items are considered a read/write menu item, because, when either are selected, both the *INPUT* and small (=) annunciators are lit in the top right corner of the HP 20b display. When lit, these annunciators indicate that entering a number and pressing  will store the entered number in the displayed menu item. Pressing  (outside of a mathematical operation), on the other hand, would calculate the value for that item based on available data. The Accrued menu item is output only. This means it will show a computed value once enough other information has been entered, but is not changeable by the user.

The other menu items are input only. For these, only the *INPUT* annunciator is lit in the top order of the display. These menu items include the settlement date, maturity date, coupon rate and call value, in addition to the mode change selections.

To clear the bond menu while in the menu, press  .

Variable	Description
<i>Settlement Date</i>	Settlement date. Displays the current settlement date in either <i>mm.ddyyyy</i> or <i>dd.mmyyyy</i> format. Note: input only.
<i>Maturity Date</i>	Maturity date or call date. The call date must coincide with a coupon date. Displays the current maturity date in either <i>mm.ddyyyy</i> or <i>dd.mmyyyy</i> format. Note: Input only.
<i>CPN%</i>	Coupon rate stored as an annual %. Note: Input only.
<i>Call</i>	Call value. Default is set for a call price per \$100.00 face value. A bond at maturity has a call value of 100% of its face value. Note: Input only.
<i>Yield%</i>	Yield% to maturity or yield% to call date for given price. Note: Input/Output.
<i>Price</i>	Price per \$100.00 face value for a given yield. Note: Input/Output.
<i>Accrued</i>	Interest accrued from the last coupon or payment date until the settlement date for a given yield. Note: Output only.
<i>Actual/Cal.360</i>	Actual (365-day calendar) or Cal.360 (30-day month/360-day year calendar). Press <input type="button" value="INPUT"/> to change modes.
<i>Annual/Semiannual</i>	Bond coupon (payment) frequency. Press <input type="button" value="INPUT"/> to change modes.

Example 1: What price should be paid on August 1, 2009 for a 6.75% US Treasury bond that matures on May 1, 2018, if the yield is 8.375%? The bond coupon payments are semiannual and under a 30/360 convention. This example assumes dates are entered in the MM.DDYYYY format.

ON/CE	ON/CE	Bond		Reset	INPUT						(Enters the settlement date)	
8	.	0	1	2	0	0	9	INPUT			(Enters the maturity date)	
▼	5	.	0	1	2	0	1	8	INPUT			
▼	6	.	7	5	INPUT							(Enters the coupon rate)
▼	▼	8	.	3	7	5	INPUT					(Enters the yield)
▼	▼	▼	INPUT									(Displays Actual / Cal.360 mode status. Press only if the screen shows Actual.)
▼	INPUT											(Displays Annual / Semiannual mode status. Press only if the screen shows Annual.)
▲	▲	▲	=									(Computes the price)

HP 20b Bonds - Version 1.0

Example 2: For the previous problem, what is the accrued interest?

Solution: Assuming no other changes since the computing of the price, press: 

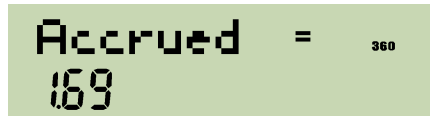

Figure 3

Answer: The accrued interest is \$1.69 per \$100 of face value. The total amount owed to the seller is the price plus accrued interest.

Example 3: For the bond as presented in problem 1, if the price is actually \$88.25 per \$100 of face value, what is the yield to maturity?

Solution:        (Enters the new price)
 

Figure 4

Answer: The yield is now 8.69%.

Example 4: What price should be paid on December 1, 2009 for a 5.95% US Treasury bond that matures on July 20, 2010, if the yield is 5.5%? The bond coupon payments are semiannual and under a 30/360 convention. This example assumes dates are entered in the MM.DDYYYY format.

Solution:      
          (Enters the settlement date)
          (Enters the maturity date)
      (Enters the coupon rate)
      (Enters the yield)
    (Displays Actual / Cal.360 mode status. Press  only if the screen shows Actual.)
  (Displays Annual / Semiannual mode status. Press  only if the screen shows Annual.)
    (Computes the price)

Figure 5

Answer: The price is \$100.27 per \$100 of face value plus accrued interest.

Example 5: For the previous problem, what is the accrued interest?

Solution: Assuming no other changes since the computing of the price, press: 

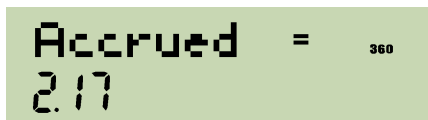

Figure 6

Answer: The accrued interest is \$2.17 per \$100 of face value. The total amount owed to the seller is the price plus accrued interest.

Example 6: A bond is callable until March 10, 2012 at 104% of face value, but has a maturity date of March 10, 2022. What is the yield to call for this bond on September 15, 2008, if the price of the bond is 98.5 and its coupon rate is 6.5% The bond coupon payments are semiannual and under a 30/360 convention. This example assumes dates are entered in the MM.DDYYYY format.

Solution:

ON/CE	ON/CE	Bond	Reset	INPUT	
9	.	1	5	2	0 0 8 INPUT
▼	3	.	1	0	2 0 1 2 INPUT
▼	6	.	5	INPUT	(Enters the coupon rate)
▼	1	0	4	INPUT	(Enters the call %)
▼	▼	9	8	.	5 INPUT
▼	▼	INPUT			(Enters the price)
▼	▼	INPUT			(Displays Actual / Cal.360 mode status. Press INPUT only if the screen shows Actual.)
▼	INPUT				(Displays Annual / Semiannual mode status. Press INPUT only if the screen shows Annual.)
▲	▲	▲	▲	=	(Computes the yield to call)

Figure 7

Answer: The yield to call is 8.02%.

Example 7: Since the bond in example 6 is selling for a discount relative to the face value, it is unlikely that it will be called, so it is unlikely that the investor's return will really be 8.02%. Compute the yield to maturity after resetting the call value to 100 and compare it to the yield to call. Assume example 6 has just been completed and note that the non-call maturity date is March 10, 2022.

▲	1	0	0	INPUT	(Resets the call% to 100)
▲	▲	3	.	1	0 2 0 2 2 INPUT
▼	▼	▼	=		(Computes the yield to maturity)

Figure 8

Answer: The yield to maturity is 6.67%, which is probably a better estimate of the investor's return.
